

Network Automation Foundations

Presented By CBTS & Arista Networks

8-6-2019
Craig Bruenderman
CCIE #46341

Rhetorical Questions

- Why are you here?
- What is your problem statement?
- Do you know how your business makes money?
 - What is your Unit of Value?
 - Knowing that will help you connect to your business
- What are your use cases?

Network Automation

- ✖ What?
 - ✖ “Network automation is the process of automating the configuration, management, testing, deployment, and operations of physical and virtual devices within a network. Every day network tasks and functions are performed automatically.” Juniper Networks
- ✖ Why?
 - ✖ Speed? Maybe.
 - ✖ Multiplex yourself
 - ✖ Predictability/Determinism
 - ✖ Drive heterogeneous environments with same toolkit
 - ✖ Reduce the mundane and get to workflows that move your career, and your business forward

Basic Toolkit

- Python Programming Language
- Fundamental Data Structures
- IDE
 - Combines a text editor with add-ons such as code completion, debugging, build tools, version control integration, integrated terminal, etc.
- API Concepts
- SDK Concepts

Python

- General-purpose object-oriented programming language developed since the 1980's by Guido van Rossum
- Open source, itself written in C
- Interpreted
 - Internally, your source code is translated into machine code
 - Byte code then runs in a platform virtual machine, similar to Java
- High-level language, so approachable, easy(ish) to read by humans
- Huge ecosystem of extension libraries
 - Text processing, Bioinformatics, Network Automation, Machine Learning...

Python Versions

- Python 2
 - Lots of code written for Python 2.7
 - 2.7 will be deprecated on Jan 1 2020
 - <https://pythonclock.org/>
- **Python 3**
 - Start here
 - Certainly differences, but minimal for our purposes when starting out
 - `print "Hello World"` becomes `print("Hello World")`

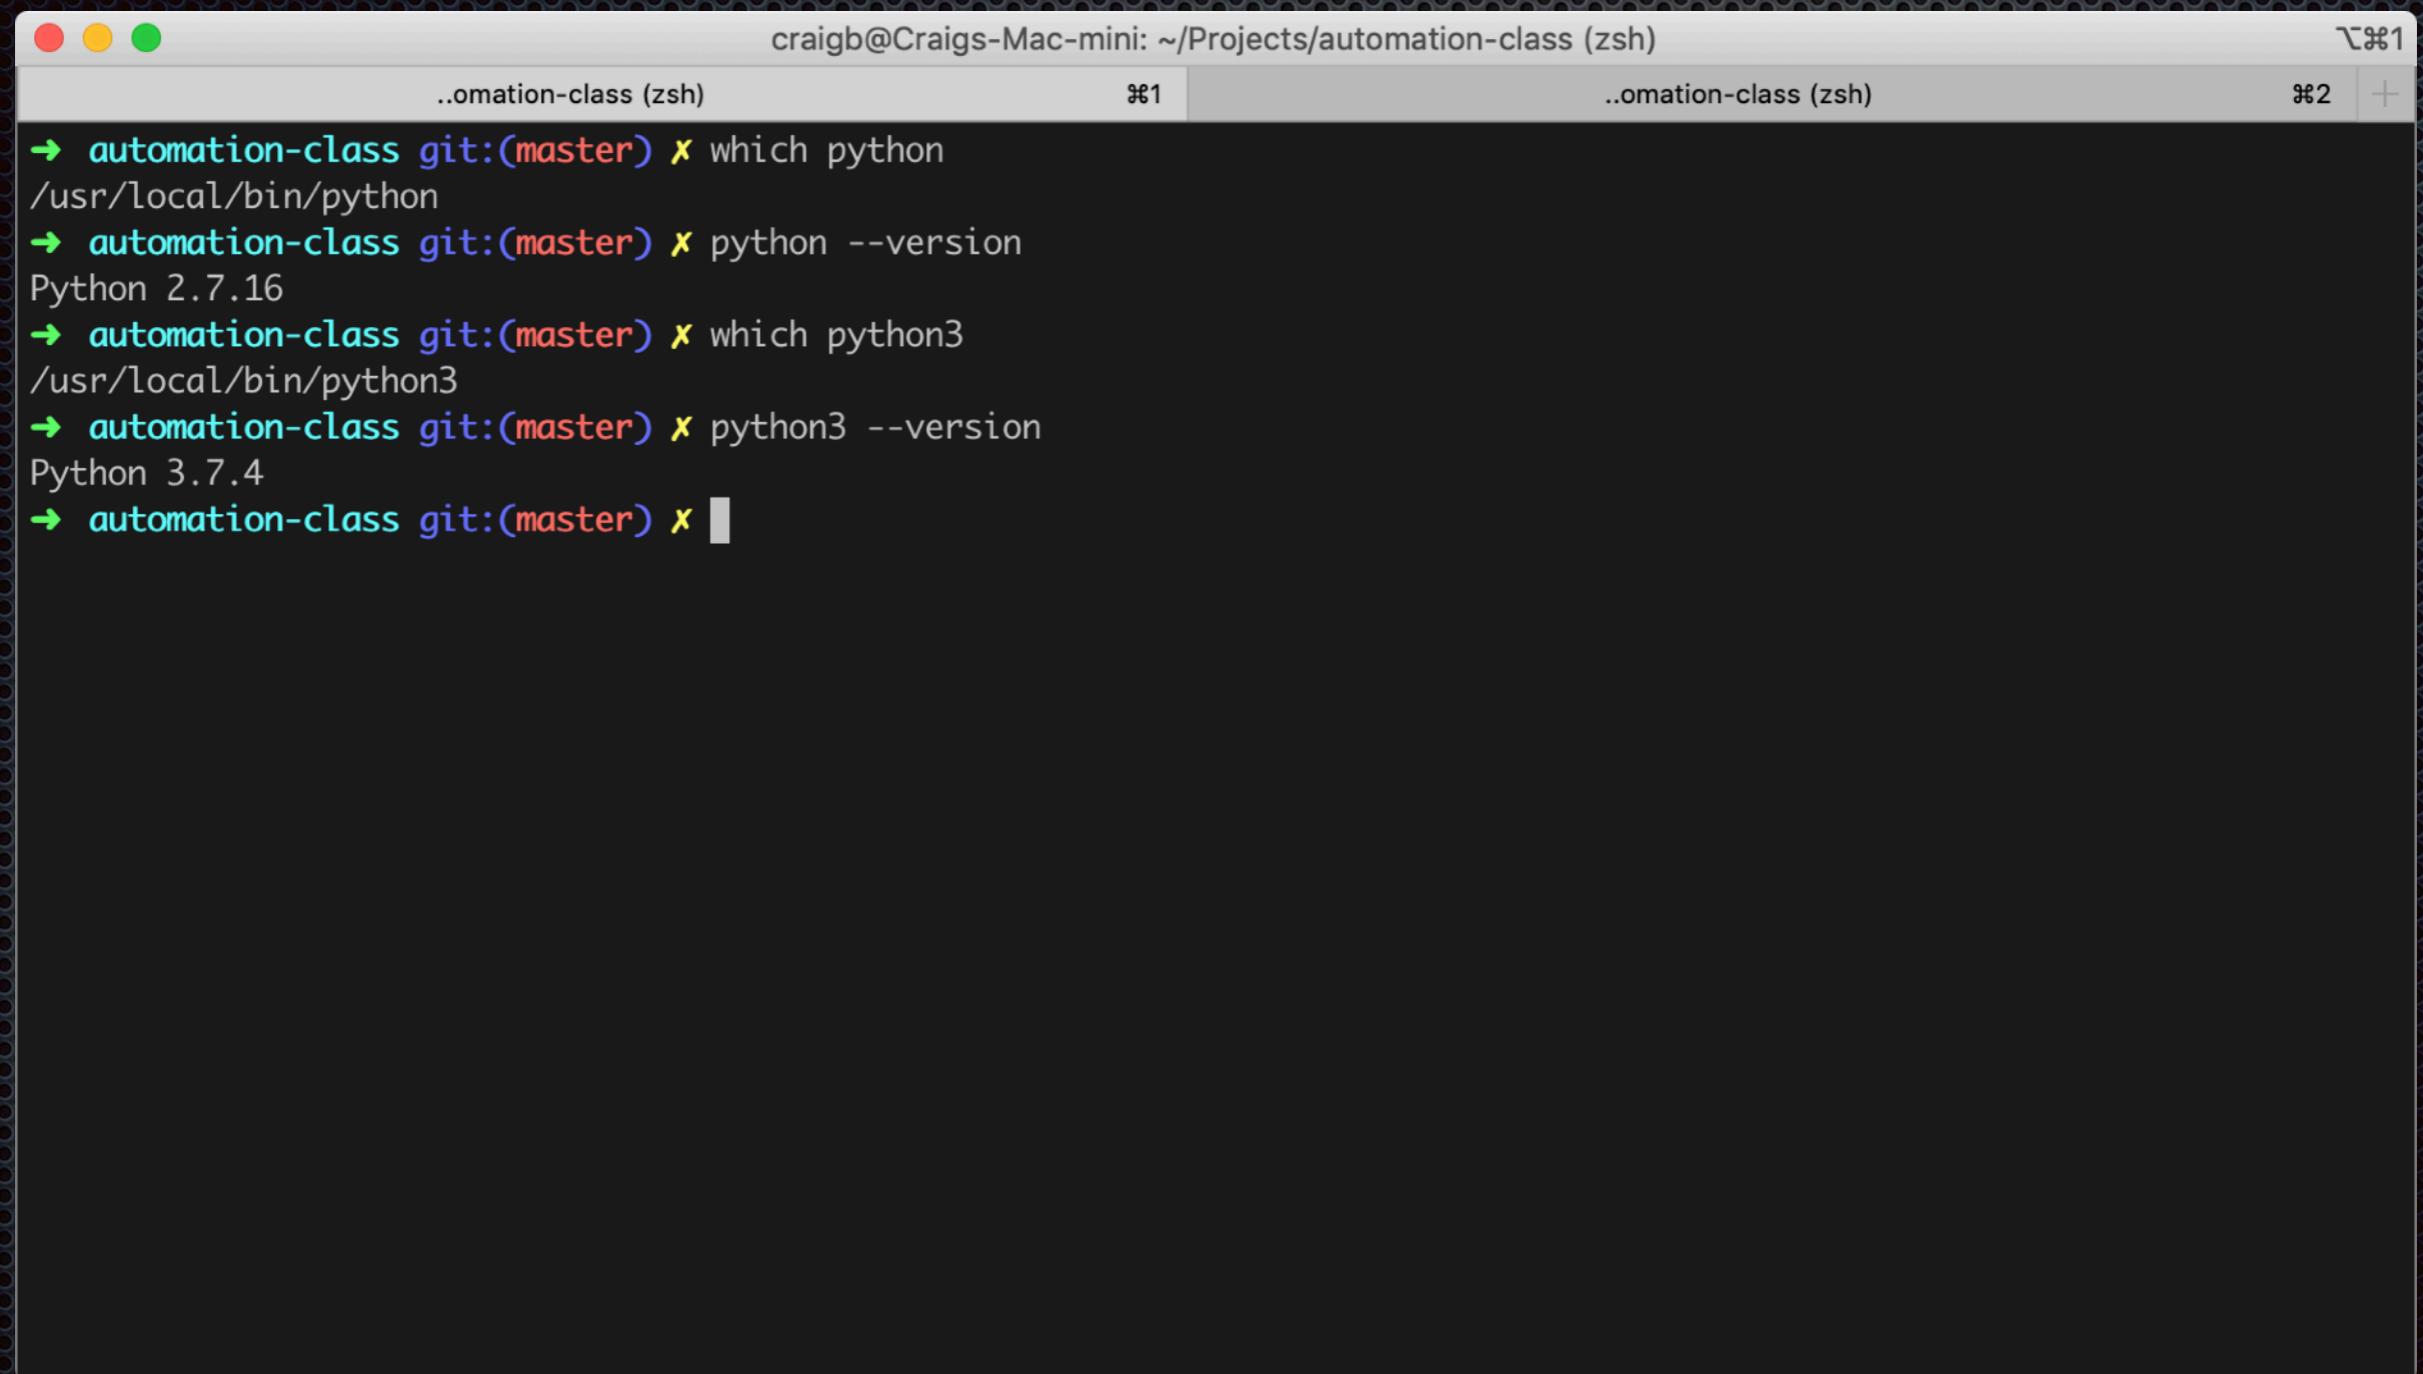

Python Run Modes

- Interactive
 - Run python from CLI
 - Do prototyping here
 - Can't do this with compiled languages
- Scripted
 - Capture your code in .py files

Python Modules

- These are Python libraries you can include to avoid reinventing the wheel
- PIP - Package manager to install/remove/upgrade Modules
- Netmiko
 - Module / library for interacting with network equipment

Lab 1.1 - Python Paths and Versions

craigb@Craigs-Mac-mini: ~/Projects/automation-class (zsh)

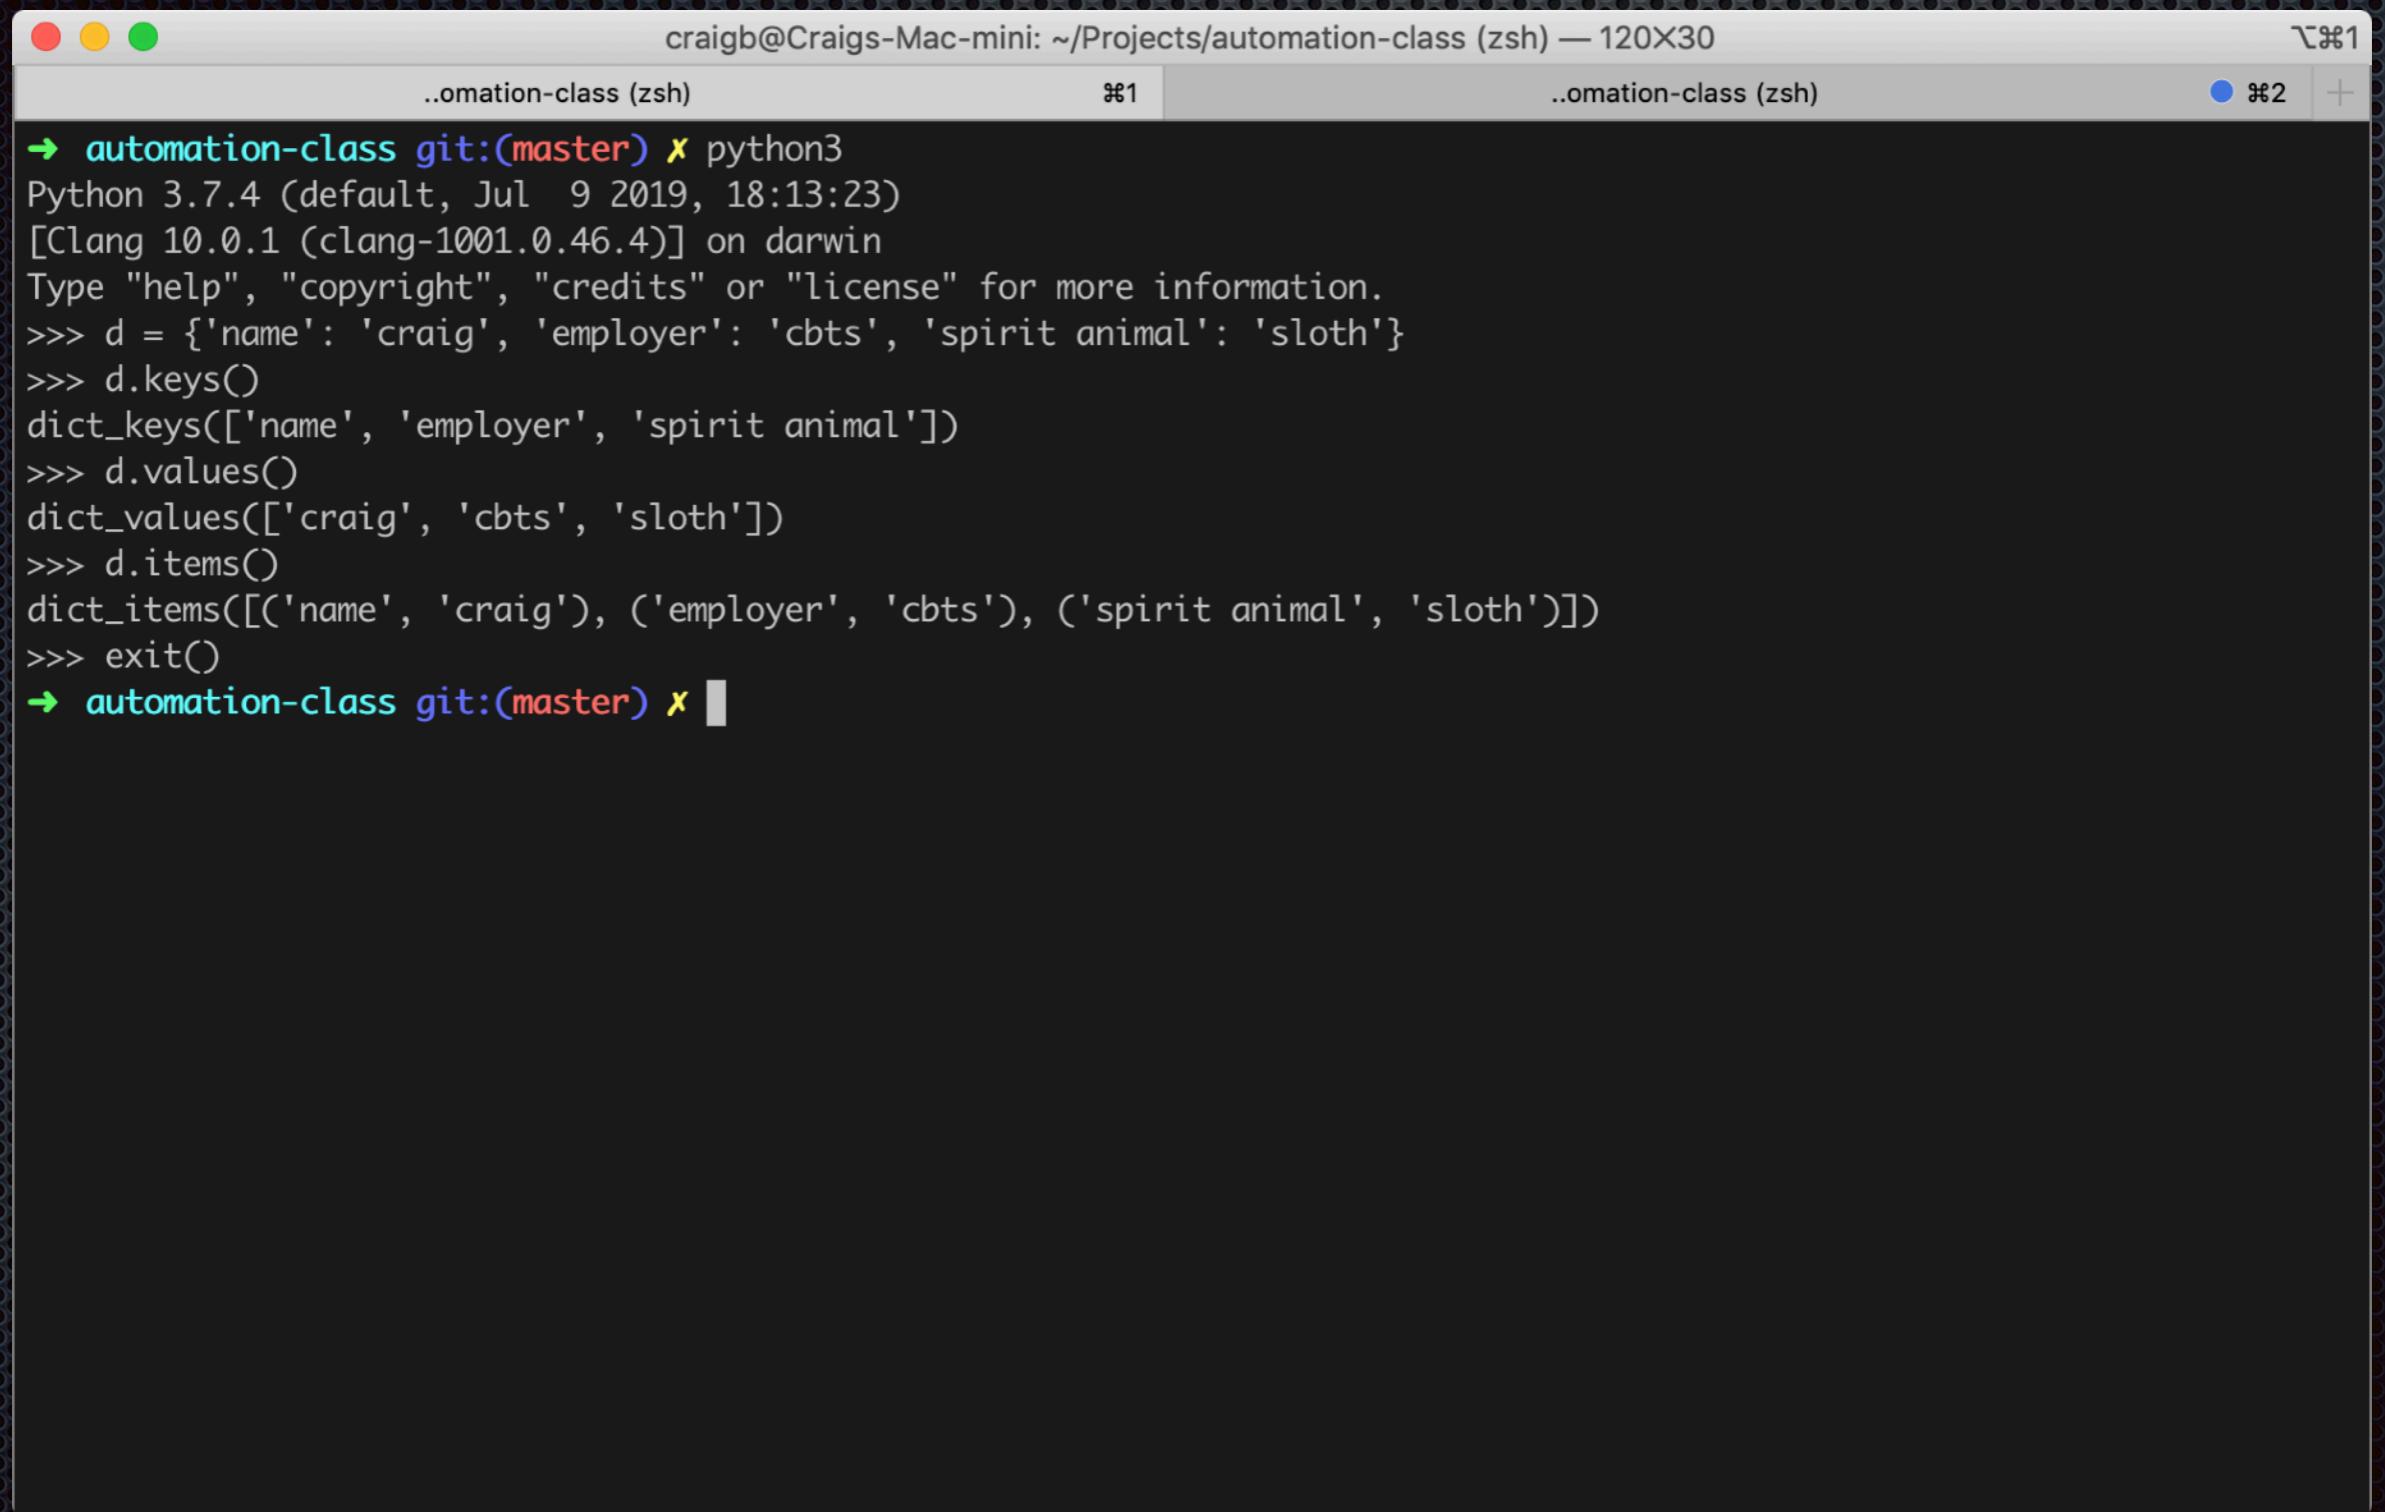

..omation-class (zsh)⌘1 ..omation-class (zsh)⌘2 +

```
→ automation-class git:(master) ✘ which python
/usr/local/bin/python
→ automation-class git:(master) ✘ python --version
Python 2.7.16
→ automation-class git:(master) ✘ which python3
/usr/local/bin/python3
→ automation-class git:(master) ✘ python3 --version
Python 3.7.4
→ automation-class git:(master) ✘
```

Lab 1.2 - Pip Package List

```
craigb@Craigs-Mac-mini: ~/Projects/automation-class (zsh)
..omation-class (zsh)          #1           ..omation-class (zsh)          #2
→ automation-class git:(master) ✘ pip list
DEPRECATION: Python 2.7 will reach the end of its life on January 1st, 2020. Please upgrade your Python as Python 2.7 won't be maintained after that date. A future version of pip will drop support for Python 2.7.
Package           Version
-----
asn1crypto        0.24.0
astroid           1.6.5
backports.functools-lru-cache 1.5
bcrypt            3.1.7
certifi           2019.3.9

python-dateutil   2.8.0
PyYAML            5.1.1
scp               0.13.2
setuptools        40.8.0
singledispatch    3.4.0.3
six               1.12.0
textfsm           0.4.1
ucsmsdk          0.9.8
```

Lab 1.3 - Interactive Python

The screenshot shows a macOS terminal window with two tabs open. The active tab, labeled '#1', displays an interactive Python session. The session starts with the Python interpreter's banner:

```
craigb@Craigs-Mac-mini: ~/Projects/automation-class (zsh) — 120X30
..omation-class (zsh) #1 ..omation-class (zsh) #2 +
```

Then, the user enters the following code:

```
→ automation-class git:(master) ✘ python3
Python 3.7.4 (default, Jul  9 2019, 18:13:23)
[Clang 10.0.1 (clang-1001.0.46.4)] on darwin
Type "help", "copyright", "credits" or "license" for more information.
>>> d = {'name': 'craig', 'employer': 'cbts', 'spirit animal': 'sloth'}
>>> d.keys()
dict_keys(['name', 'employer', 'spirit animal'])
>>> d.values()
dict_values(['craig', 'cbts', 'sloth'])
>>> d.items()
dict_items([('name', 'craig'), ('employer', 'cbts'), ('spirit animal', 'sloth')])
>>> exit()
```

The session ends with the prompt:

```
→ automation-class git:(master) ✘
```

Data Objects

- Everything in Python is an Object
 - Objects are just pieces of memory with values and sets of associated operations
- Python has several built-in data object types
 - Numbers, Strings, booleans
 - Lists, Dictionaries, Tuples
- More to this topic, but that will get us started

Lists

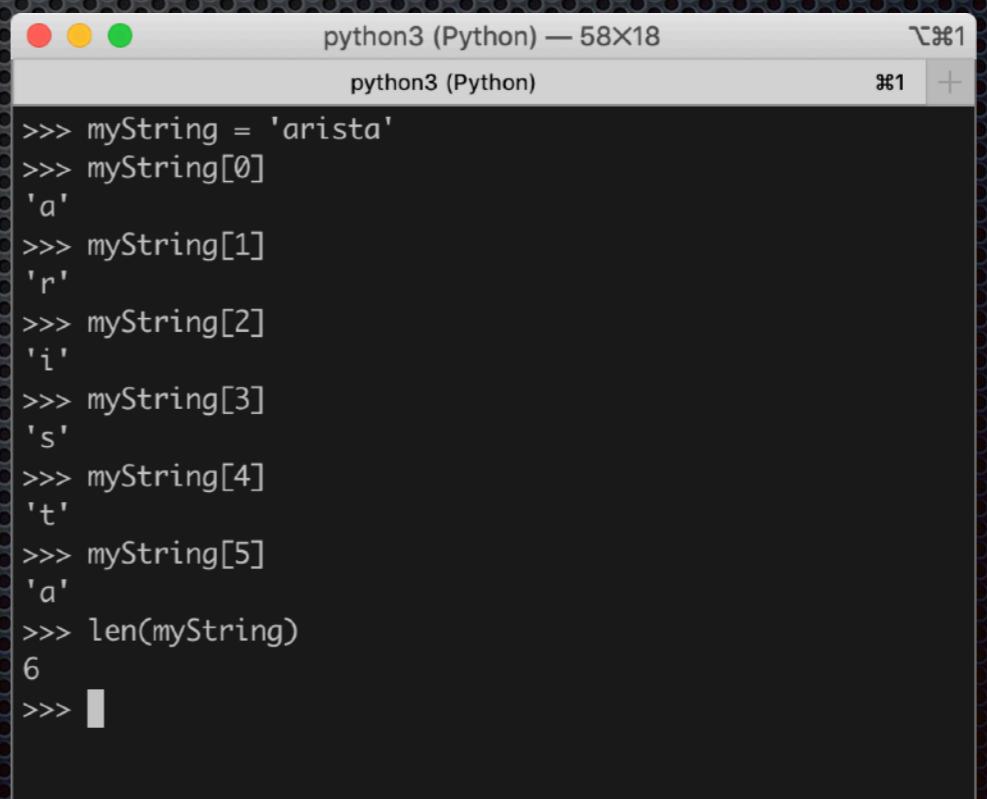

- Positionally ordered sequence of data objects
- Entries are indexed (referenced) by their integer index, which starts at 0
- In Python, a string is technically a list of single-character strings

- Examples

- In Python

- In JSON

- In YAML

```
python3 (Python) — 58×18
python3 (Python)
>>> myString = 'arista'
>>> myString[0]
'a'
>>> myString[1]
'r'
>>> myString[2]
'i'
>>> myString[3]
's'
>>> myString[4]
't'
>>> myString[5]
'a'
>>> len(myString)
6
>>>
```

Dictionaries

- Unordered mappings of key - value pairs
- Entries are indexed by their key, which can be multiple types, but is often a string
- Examples
 - In Python
 - In JSON
 - In YAML

Data Structure

- **Unstructured** - No predefined data model
 - Text files, media files, screen scrapes
- **Structured** - Pre-defined data types with predictable characteristics; easy to parse; usually text-based
 - Dates, IP addresses, E.164 telephone numbering plan
- **Semi-Structured** - Somewhere in between; uses internal tags and/or hierarchy to establish parent/child relationships
 - XML, JSON (Javascript Object Notation), YAML (YAML Ain't Markup Language)

Data Exchange Formats

- Designed to be exchanged/consumed by software
- Several to choose from
 - XML — Heavier weight
 - JSON — Lighter weight, maps closely to native data structures in programming languages
 - YAML — Easiest to read
- Largely used for storing and exchanging:
 - Lists (Arrays)
 - Dictionaries (Associative Arrays)

Lab 2.1 - Lab Prep

- <http://bit.ly/cbautomation>

The screenshot shows a macOS terminal window with two tabs. The active tab, labeled '#1', displays the command `git clone https://github.com/craigbruenderman/automation-class.git` and its output, which shows the repository has been cloned successfully. The second tab, labeled '#2', shows the command `tree automation-class` and its output, which lists the contents of the cloned repository, including a `Lab_Guide.md` file, a `Lab_Guide.pdf`, a `Network_Foundations_Preso.key`, a `Network_Foundations_Preso.pdf`, a `README.md` file, and a `code` directory containing various configuration files and Python scripts.

```

```

Lab 2.3 - Data Structures

The screenshot shows a terminal window with two panes. The left pane is a file browser titled 'Project' showing the directory structure of a project named 'automation-class'. The right pane is a code editor titled 'ports.yml — ~/Projects/automation-class' displaying a YAML configuration file.

File Browser (Left):

- automation-class
 - .git
 - code
 - group_vars
 - host_vars
 - reports
 - facts
 - facts.j2
 - master.md
 - master.pdf
 - hosts
 - lab2.2.py
 - lab2.3.py
 - lab4.1.py
 - lab7.1.yml
 - lab7.2.yml
 - lab8.1.yml
 - ports.json
 - ports.yml
 - .DS_Store

Code Editor (Right):

```
ports.yml — ~/Projects/automation-class
ports.yml          Lab_Guide.md      lab2.2.py      lab4.1.py
1 - interface: FastEthernet0/28
2   description: AppleTV
3   mode: access
4   vlan: 10
5
6 - interface: FastEthernet0/29
7   description: IP Camera
8   mode: access
9   vlan: 11
10
11 - interface: FastEthernet0/30
12   description: ESXi Host
13   mode: trunk
14
15 - interface: FastEthernet0/31
16   description: IP Phone
17   mode: access
18   vlan: 12
19
```

File status indicators at the bottom:

- + code/ports.yml 1:1
- LF
- UTF-8
- YAML
- (g)
- master
- Fetch
- GitHub
- Git (4)

Lab 2.3 - Convert Between Data Structures

IDE Overview

- Integrated Development Environment
- Distinction between IDE and Code Editor not always clear
- Integrate several tools
 - Source code editor with syntax highlighting, auto-completion
 - Shortcuts
 - Plugin System
 - Version Control System Integration
 - Build, execution, debugging tools

IDE Options

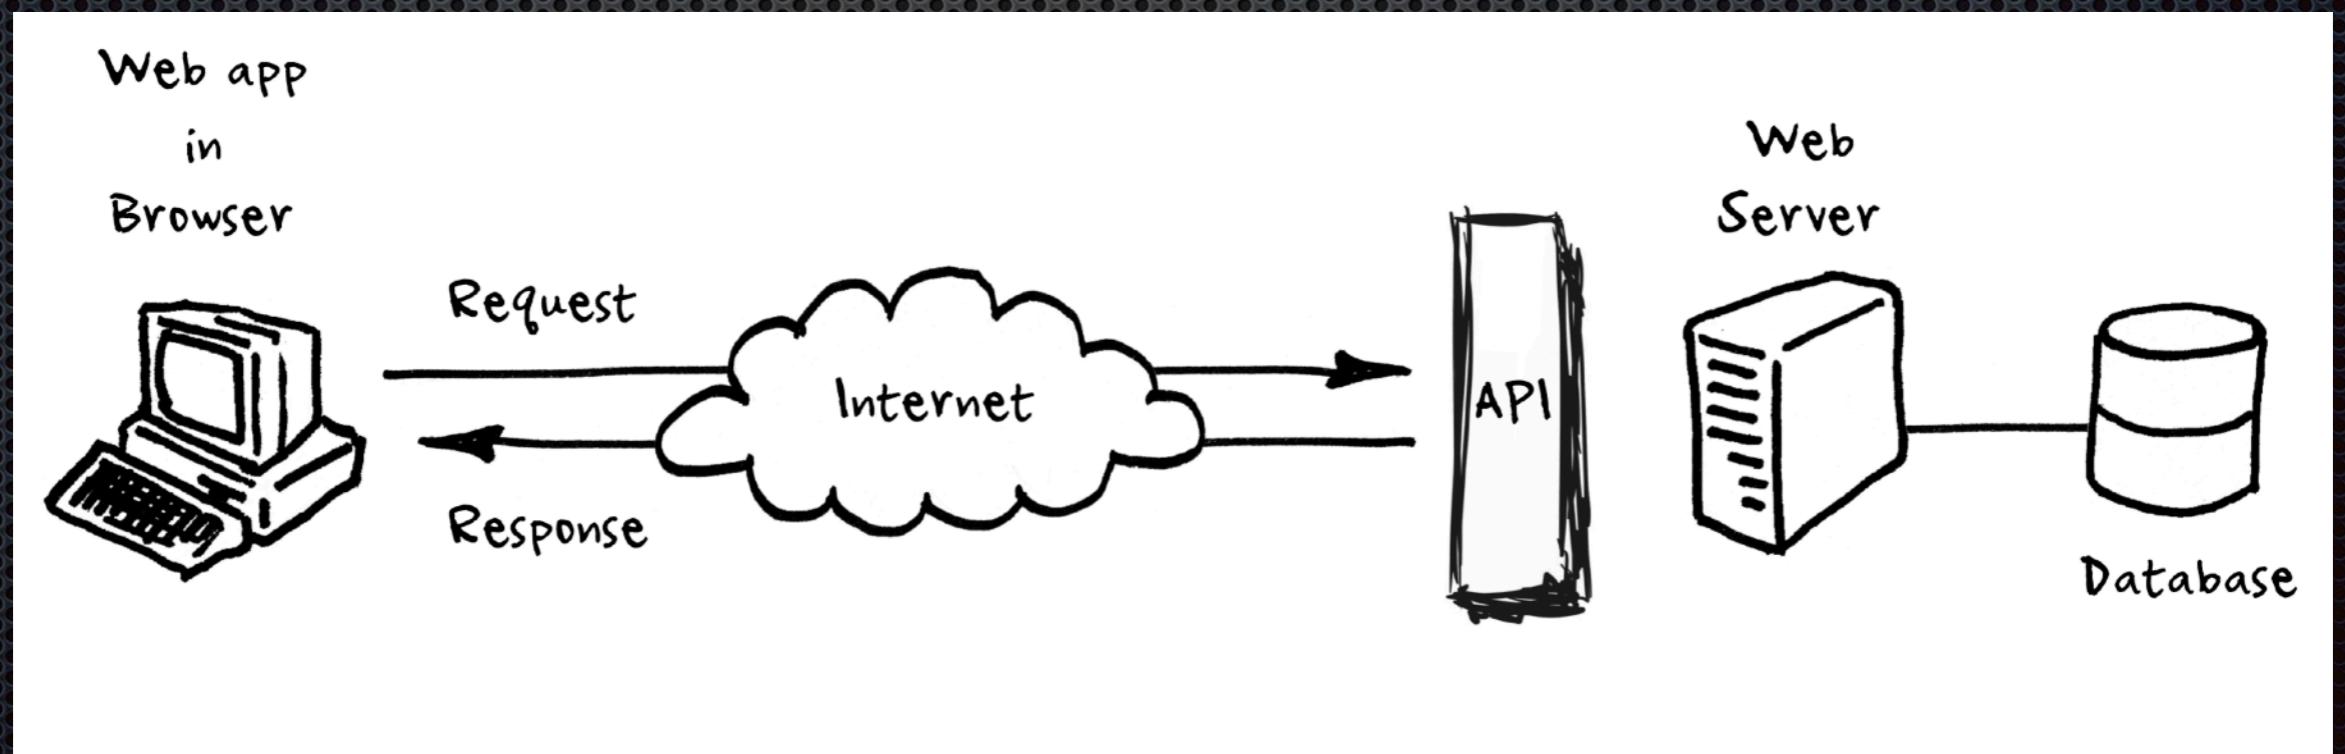

- Visual Studio Code
 - Multi-platform, Open Source, developed by Microsoft
- Atom
 - Multi-platform, Open Source, developed by Google
- PyCharm
 - Multi-platform, Freemium, developed by JetBrains
- Sublime Text
 - Multi-platform, Commercial

API Overview

- Application Programming Interface
- In basic terms, APIs just allow applications to communicate with one another.
- When people speak of “an API”, they sometimes generalize and actually mean “a publicly available web-based API that returns data, likely in JSON or XML”
- The API is not the database or even the server, it is the code that governs the access point(s) for the server

Web Services API

- Data exchange format is XML or JSON
- This lets us represent complex data structures
- Web Services APIs exchange data using HTTP(s) as transport

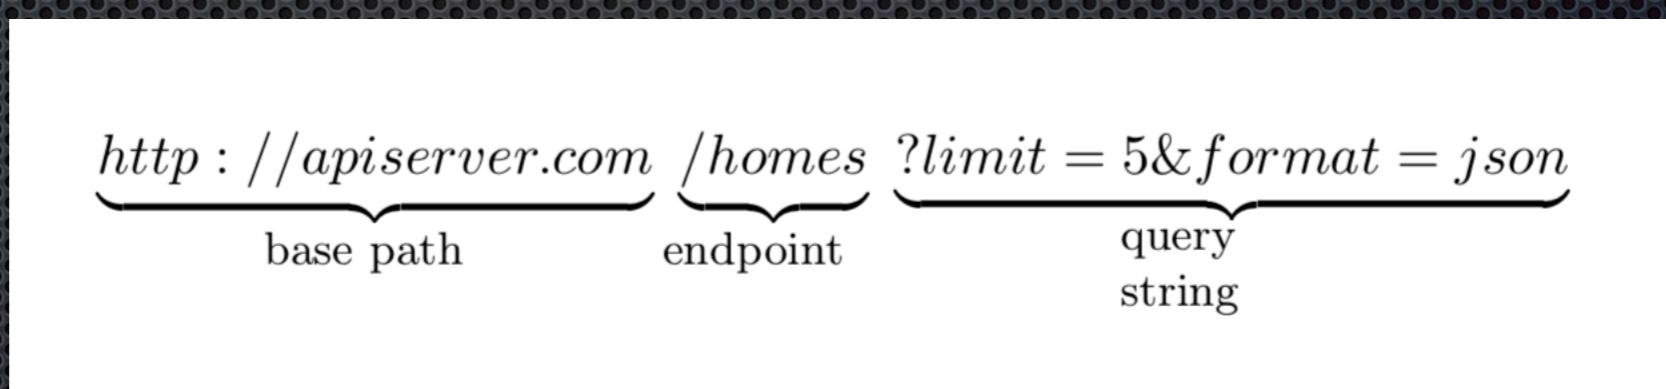

REST Overview

- An architectural style defined by a set of principles developed by Roy Fielding in his PhD work
 - Style, not a standard or a protocol
- Focuses on resources (that is, things, rather than actions) and ways to access the resources
- Resources are different types of information accessed through URLs
- Just like going to a URL in your browser retrieves an information resource
- The URLs are accompanied by an HTTP method that specifies how you want to interact with the resource

Database	HTTP
Create	POST
Read	GET
Update	PUT
Delete	DELETE

REST Overview

- The base path (or base URL or host) refers to the common path for the API
- The endpoint refers to the end path of the endpoint
- The query string contains parameters for the endpoint

The diagram illustrates the structure of a REST API URL. It shows a URL: `http://apiserver.com/homes?limit=5&format=json`. The URL is divided into three main parts: `http://apiserver.com` is labeled "base path"; `/homes` is labeled "endpoint"; and `?limit=5&format=json` is labeled "query string".

Web Service API - Arista eAPI

- eAPI is Arista's Web Service API
 - Provides a method for simply interacting with Arista gear without CLI interaction
- HTTP(s) transport
- JSON Request and Response
- eAPI allows CLI Commands to be issued remotely
- eAPI returns output as JSON, generally in key-value pairs

Navigating Web Service APIs

- Browser-based interaction
- Postman interaction
- Python REST interaction with requests library
- Python specific client library interaction (like pyeapi)
- Ansible interaction

Lab 3 - eAPI Command Explorer

The screenshot shows two windows side-by-side. On the left is the 'Command API Explorer' window, which includes a 'Simple Request' tab and a 'Script Editor' tab. The 'Simple Request' tab is active, displaying a form to craft eAPI requests. It has fields for 'API Endpoint' (set to https://192.168.0.14/command-api), 'Version' (set to 1), 'Format' (set to 'json'), 'Timestamps' (set to false), 'AutoComplete' (set to false), 'ExpandAliases' (set to false), and an 'ID' field (set to EapiExplorer-1). Below the form is a 'Submit POST request' button. At the bottom of the window are 'Request Viewer' and 'Response Viewer' tabs, with the 'Request Viewer' tab currently selected. The 'Request Viewer' contains the command '1'. The 'Response Viewer' tab is also present but not yet populated. On the right is the 'Response Viewer' window, titled 'Response Viewer'. It displays a JSON response with line numbers from 1 to 25 on the left. The JSON content is as follows:

```
1 {  
2   "jsonrpc": "2.0",  
3   "id": "EapiExplorer-1",  
4   "result": [  
5     {},  
6     {  
7       "interfaces": {  
8         "Ethernet2": {  
9           "lastStatusChangeTimestamp": 1498704273.1386933,  
10          "name": "Ethernet2",  
11          "interfaceStatus": "connected",  
12          "autoNegotiate": "unknown",  
13          "burnedInAddress": "00:0c:29:e7:43:09",  
14          "loopbackMode": "loopbackNone",  
15          "interfaceStatistics": {  
16            "inBitsRate": 0,  
17            "inPktsRate": 0,  
18            "outBitsRate": 0,  
19            "updateInterval": 300,  
20            "outPktsRate": 0  
21          },  
22          "mtu": 9214,  
23          "hardware": "ethernet",  
24          "duplex": "duplexFull",  
25          "bandwidth": 0,  
26        }  
27      }  
28    ]  
29  }  
30 }
```

Lab 4.1 - Add a user with pyeapi

```
arista@ip-10-33-5-52: ~/automation-class/code (ssh)
arista@ip-10-33-5-52: ~/automation-class/code (ssh) ⌘1 ..omation-class (zsh) ⌘2 +
arista@ip-10-33-5-52:~/automation-class/code$ python lab4.1.py

Expanded Toolkit

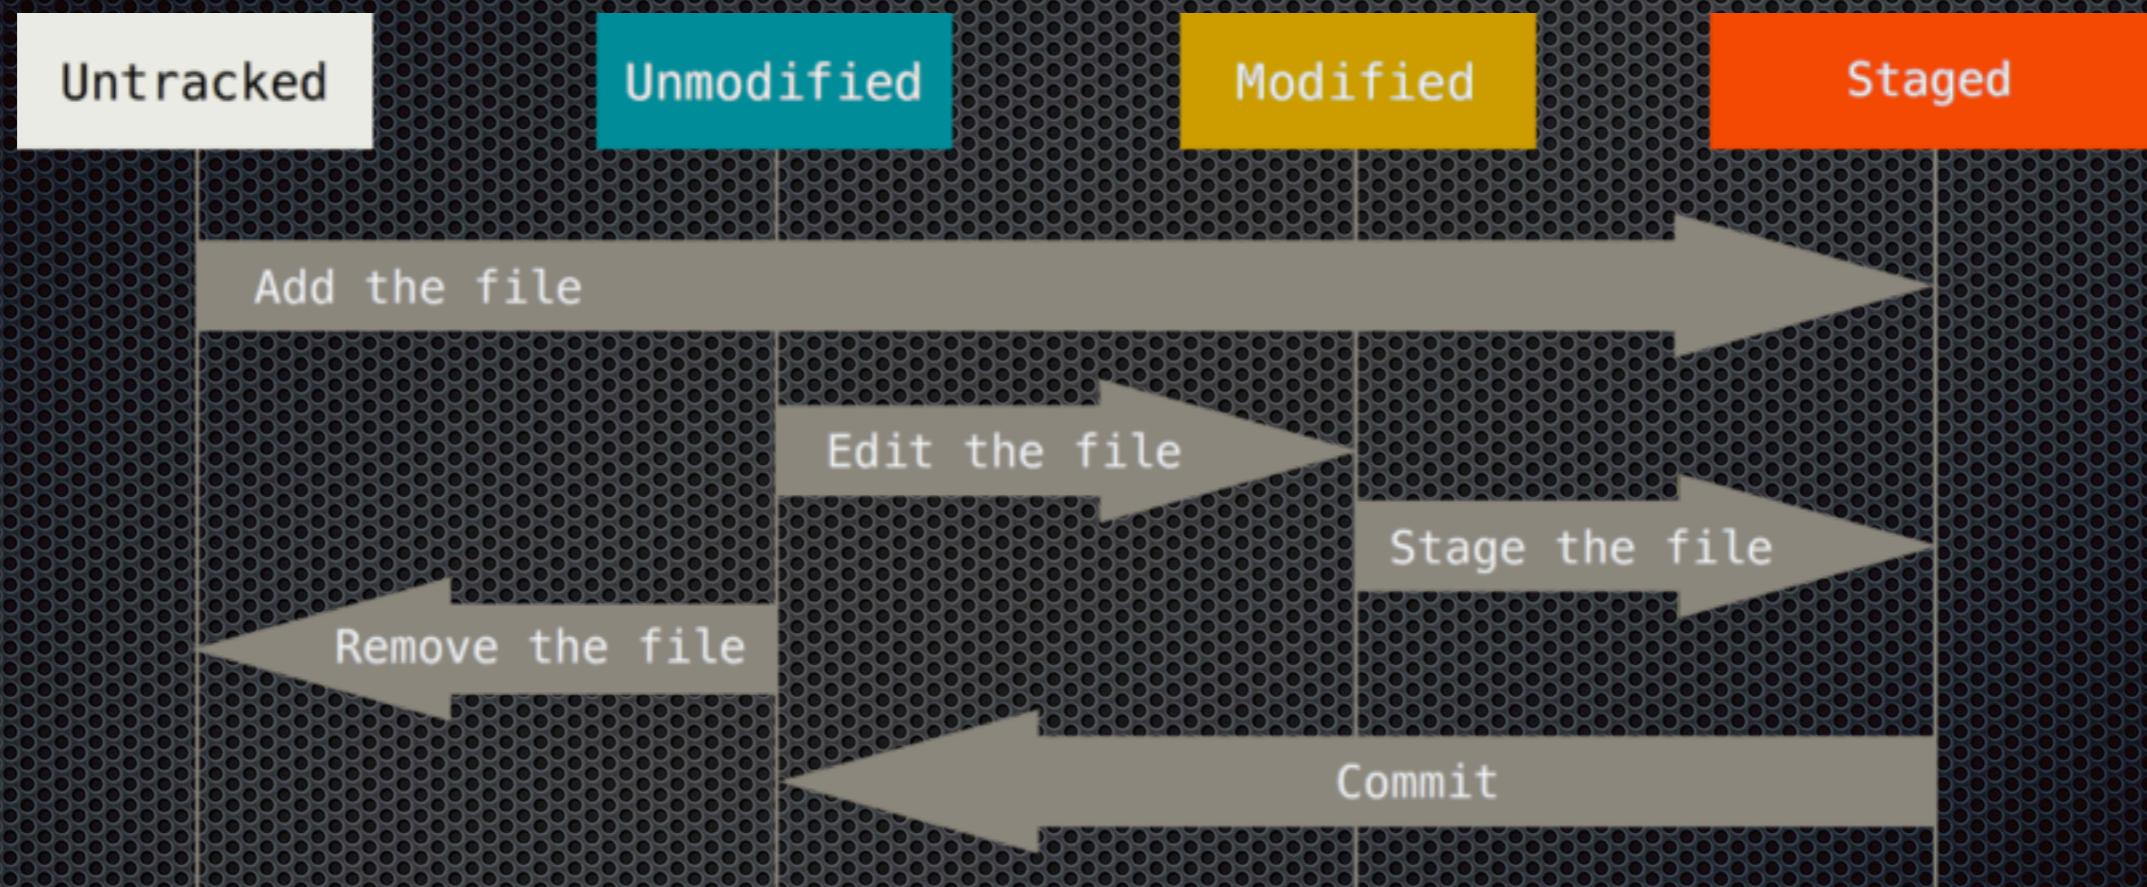

- Git
- Github
- Ansible

Git Overview

- **Version Control System** - System in which we store and maintain versioned repository of source code
 - Enables collaboration between multiple contributors
- Git is one such free source/version control system that is distributed by design
- Credit (blame) log
- Excellent free book <https://git-scm.com/book/en/v2>

Git Workflow

Lab 5.1 - Git Preferences Setup

```
aristagui@ip-10-33-5-81: ~

aristagui@ip-10-33-5-81:~/muh-bad-codez$ git status
On branch master
nothing to commit, working directory clean
aristagui@ip-10-33-5-81:~/muh-bad-codez$ █
```

Git Branches

- Branching means you diverge from the main line of development and continue to do work without messing with that main line
- These are useful for playing with features, testing, multi-user
- You probably don't want to commit incomplete or broken code, but you still want to keep it safe in the repo
- Git keeps a special pointer called HEAD that points to the current branch you're on

Lab 5.3 - Branch and Merge

- This is a bit of an advanced topic and often confusing
- Very optional

Github

- Since Git is a distributed VCS, where is the central source of truth for the repo?
 - Run your own central Git server
 - Use a SaaS
- Popular hosting service for storing Git source repositories
- Allows public and private repos
- 100MM+ repos and growing
- Uses “freemium” model
- Bought by Microsoft June 2018

Lab 5.4 - View Code Diffs in Github

Ansible Overview

- **Ansible** is an open source project for software provisioning, configuration management, and application deployment
- Infrastructure as Code Tool sponsored by Red Hat (now owned by IBM, fingers crossed)
- **AWX** - community project that enables users to better control their Ansible project use in IT environments
 - AWX is the upstream project from which the commercial Red Hat Ansible Tower offering is ultimately derived
- **Ansible Tower** - is produced by taking selected releases of AWX, hardening them for long-term supportability, and making them available to customers as the Ansible Tower offering

Ansible

- Simple, yet extremely powerful automation
- Agent-less and self-contained
- Uses SSH or Web Service as transport
- Capable of automating network devices, servers, cloud providers, VMware, many OEMs and SaaS services
- Python based, so extendable
- YAML driven, for easier digestion
- **Idempotent** — ability to perform same action repeatedly while producing the same result, without harm; making multiple identical requests has the same effect as making a single request

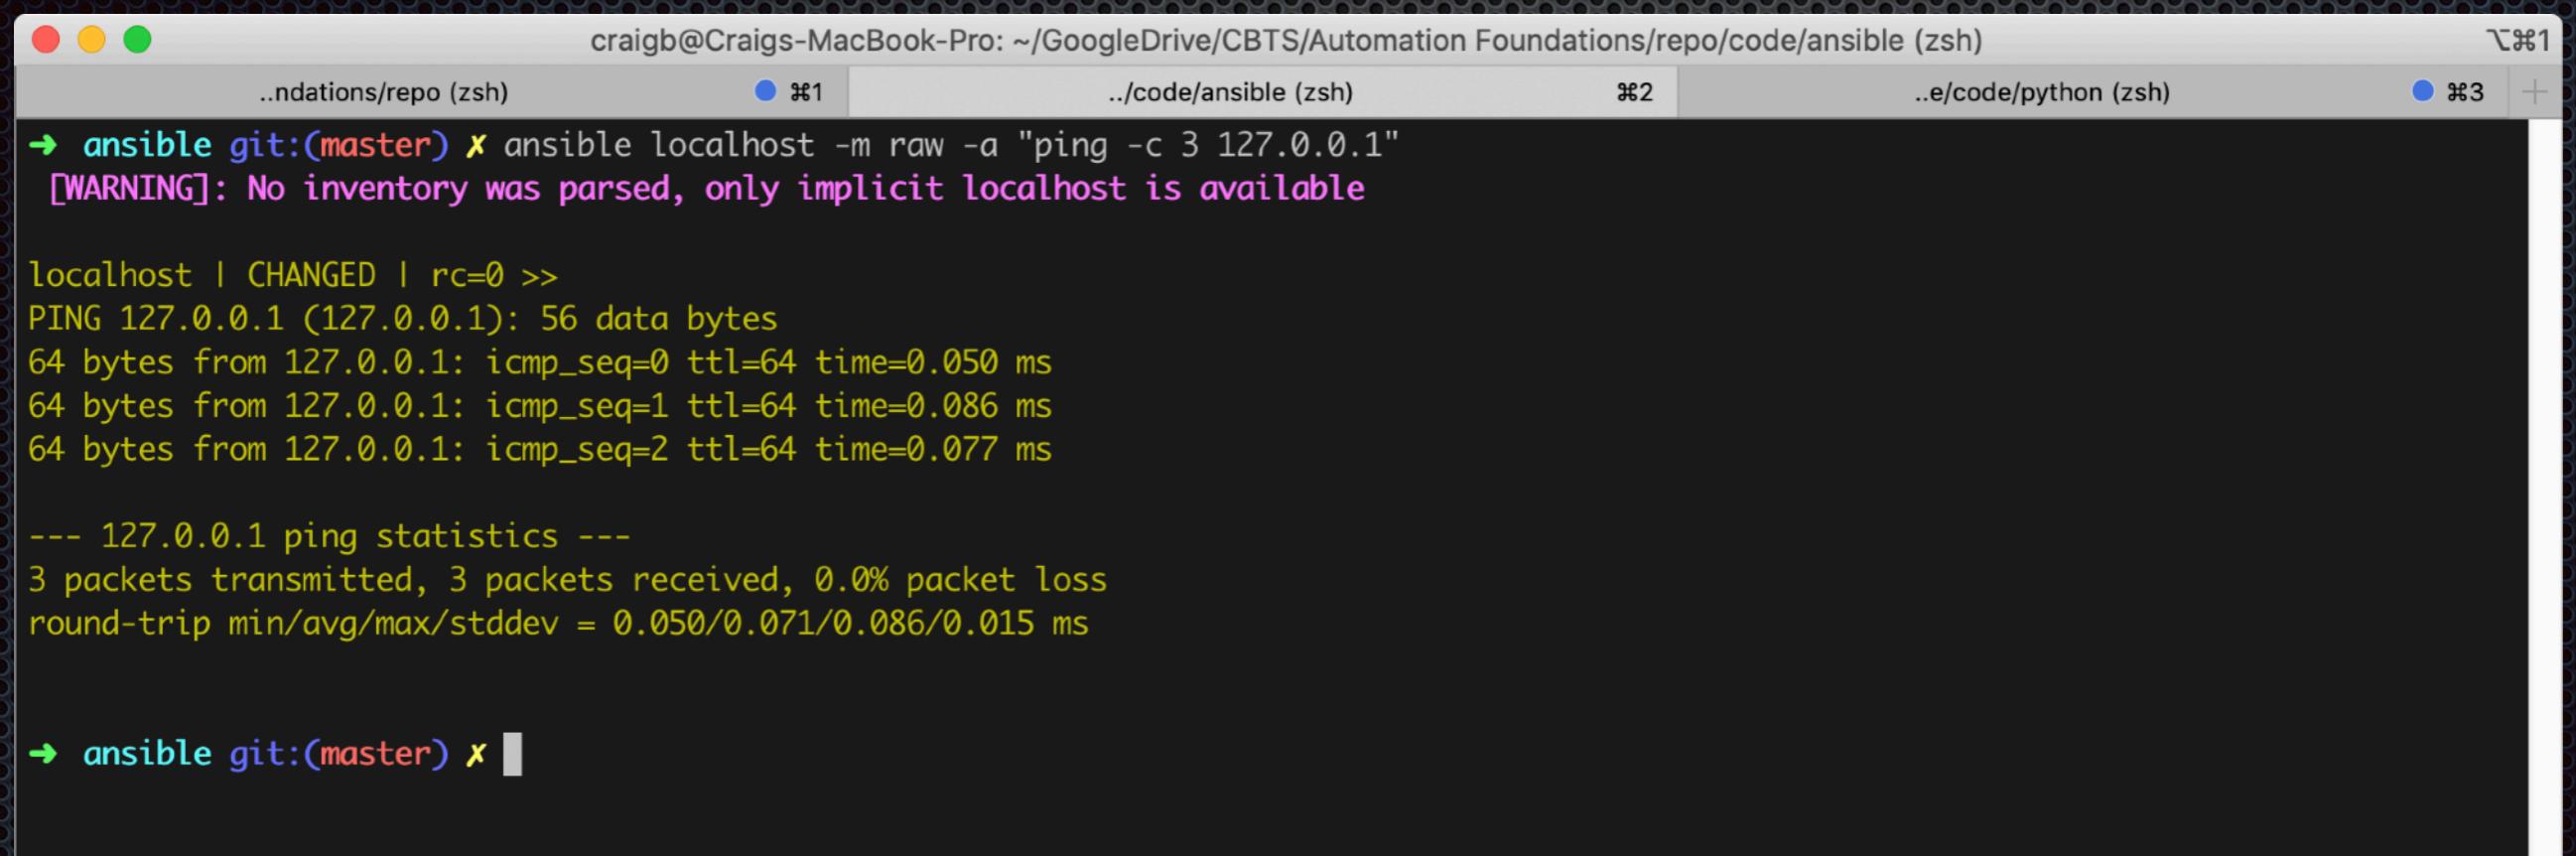

Ansible Terminology

- **Tasks** – smallest unit of work in Ansible; combines a module action with a task name
- **Play** – mapping of task instructions to the set of hosts they will run against
- **Playbook** – collection of at least one play by which Ansible orchestrates, configures, administers, or deploys systems
- **Inventory** – file that defines hosts and groups in Ansible
- **Modules** – task plugins that control particular resources

Ansible Modules

- 1200+ built-in modules including:
 - apt, yum, copy, command, cron, dns, docker, easy_install, ec2 (amazon modules), file, filesystem, find, git, known_hosts, mysql, mongodb, nagios, npm, openstack, rax (rackspace), pip, shell, snmp_facts...
- Typical modules for me
 - vmware, eos, ios, nxos, ucsm
- Modules differ in completeness

Lab 6.1 - Ansible Ad Hoc Command

The screenshot shows a macOS terminal window with three tabs open:

- ..ndations/repo (zsh)
- ../code/ansible (zsh) (selected tab)
- ..e/code/python (zsh)

The terminal output is as follows:

```
craigb@Craigs-MacBook-Pro: ~/GoogleDrive/CBTS/Automation Foundations/repo/code/ansible (zsh)
→ ansible git:(master) ✘ ansible localhost -m raw -a "ping -c 3 127.0.0.1"
[WARNING]: No inventory was parsed, only implicit localhost is available

Ansible Inventory

- Contains a list of hosts which you want Ansible to interact with
- Can be as basic as containing a list of hostnames
- Can be more complex, containing groups, groups of groups, host variables, etc.
- General advice to keep inventory files minimal and put variables elsewhere

Ansible Variables

- Often we want to set the same parameter to a different value on a per-device or group basis
- DRY principle
- Multiple ways to define vars, depending on what we need
 - Directly within playbooks
 - Within inventory
 - In separate host variables and group variables files
- There is an order of precedence when vars are defined in more than one place, but try to avoid this

Ansible Group Variables

- Stored in group_vars directory
- Apply to all of the hosts which reside inside a group
- To configure group variables simply create a YAML file which matches the name of the group
- Also an **all** group variables file which specifies variables for all groups.

Ansible Host Variables

- Stored in host_vars directory
- Host variables work the same way as Group variables
- Instead of the filename matching group name, it needs to match the host name

Ansible Variables Example Layout

```
craigb@Craigs-Mac-mini: ~/Projects/automation-class/code (zsh) — 122X27
..on-class/code (zsh)         ⌘1           ~ (zsh)          ⌘2 +
```

Anatomy of an Ansible Playbook

```
1  ---
2  # Name of the playbook
3  - name: Our first Ansible playbook
4  # List of hosts or host group to run against
5  hosts: localhost
6  # Toggle to run with root privileges
7  become: true
8
9  # Variables we define to use within this playbook
10 vars:
11   # Password to use when running command as root
12   ansible_become_password: "@rista123"
13   # Name of the package we'll install
14   package_name: "jq"
15
16  # List of tasks to be executed
17 tasks:
18   # Name of one task
19   - name: Install jq
20     # Action of this task
21     # In this case, the apt package manager module
22     apt:
23       # Actual name of the package to be installed
24       # Referencing the defined variable 'package_name'
25       name: "{{ package_name }}"
26
```

Ansible Challenges

- Very whitespace sensitive
- Documentation sometimes needs its own documentation
- Multiple connection methods aren't always clear

Lab 7.1 - Use Ansible Playbook to Install Packages

```
arista@ip-10-33-5-52: ~/automation-class/code (ssh) ⌘1 ..omation-class (zsh) ⌘2 +  
arista@ip-10-33-5-52:~/automation-class/code$ more ports.json  
[{"interface": "FastEthernet0/28", "vlan": 10, "description": "AppleTV", "mode": "access"}, {"interface": "FastEthernet0/29", "vlan": 11, "description": "IP Camera", "mode": "access"}, {"interface": "FastEthernet0/30", "description": "ESXi Host", "mode": "trunk"}, {"interface": "FastEthernet0/31", "vlan": 12, "description": "IP Phone", "mode": "access"}]  
arista@ip-10-33-5-52:~/automation-class/code$ ansible-playbook -i hosts lab7.1.yml  
  
PLAY [Our first Ansible playbook] *****  
  
TASK [Gathering Facts] *****  
ok: [localhost]  
  
TASK [Install some packages] *****  
changed: [localhost] => (item=[u'pandoc', u'jq'])  
  
PLAY RECAP *****  
localhost : ok=2    changed=1    unreachable=0    failed=0  
  
arista@ip-10-33-5-52:~/automation-class/code$ jq . ports.json  
[  
  {  
    "interface": "FastEthernet0/28",  
    "vlan": 10,  
    "description": "AppleTV",  
    "mode": "access"  
  },  
  {  
    "interface": "FastEthernet0/29",  
    "vlan": 11,  
    "description": "IP Camera",  
    "mode": "access"  
  },  
  {  
    "interface": "FastEthernet0/30",  
    "description": "ESXi Host",  
    "mode": "trunk"  
  },  
  {  
    "interface": "FastEthernet0/31",  
    "vlan": 12,  
    "description": "IP Phone",  
    "mode": "access"  
  }]  
arista@ip-10-33-5-52:~/automation-class/code$
```

Lab 7.2 - Use Ansible to interact with the Twilio REST API

- **Prize Alert**

- First one to use Ansible to send me an MMS with their email address, switch serial, and an Ansible heart wins a prize

Jinja Templating Engine

- Jinja is a Python-based templating engine that works with Ansible out of the box
- Jinja templates take variables from Ansible and then output text
- It's like mail merge for configuration
- Writing Ansible playbooks that issue sequential commands to configure all 48+ interfaces on a switch is inefficient
- Jinja is also present in other parts of Ansible, such as filters and tests
- Jinja2 is the actual name of the Python library

Lab 8.1 - Jinja Templating

```
arista@ip-10-33-5-52: ~/automation-class/code (ssh) TextEdit
arista@ip-10-33-5-52: ~/automation-class/code (ssh) ⌘1 ..omation-class (zsh) ⌘2 +
arista@ip-10-33-5-52:~/automation-class/code$ ansible-playbook -i hosts lab8.1.yml
Switch password?:

```

Use Case: Bulk Security Policy Change

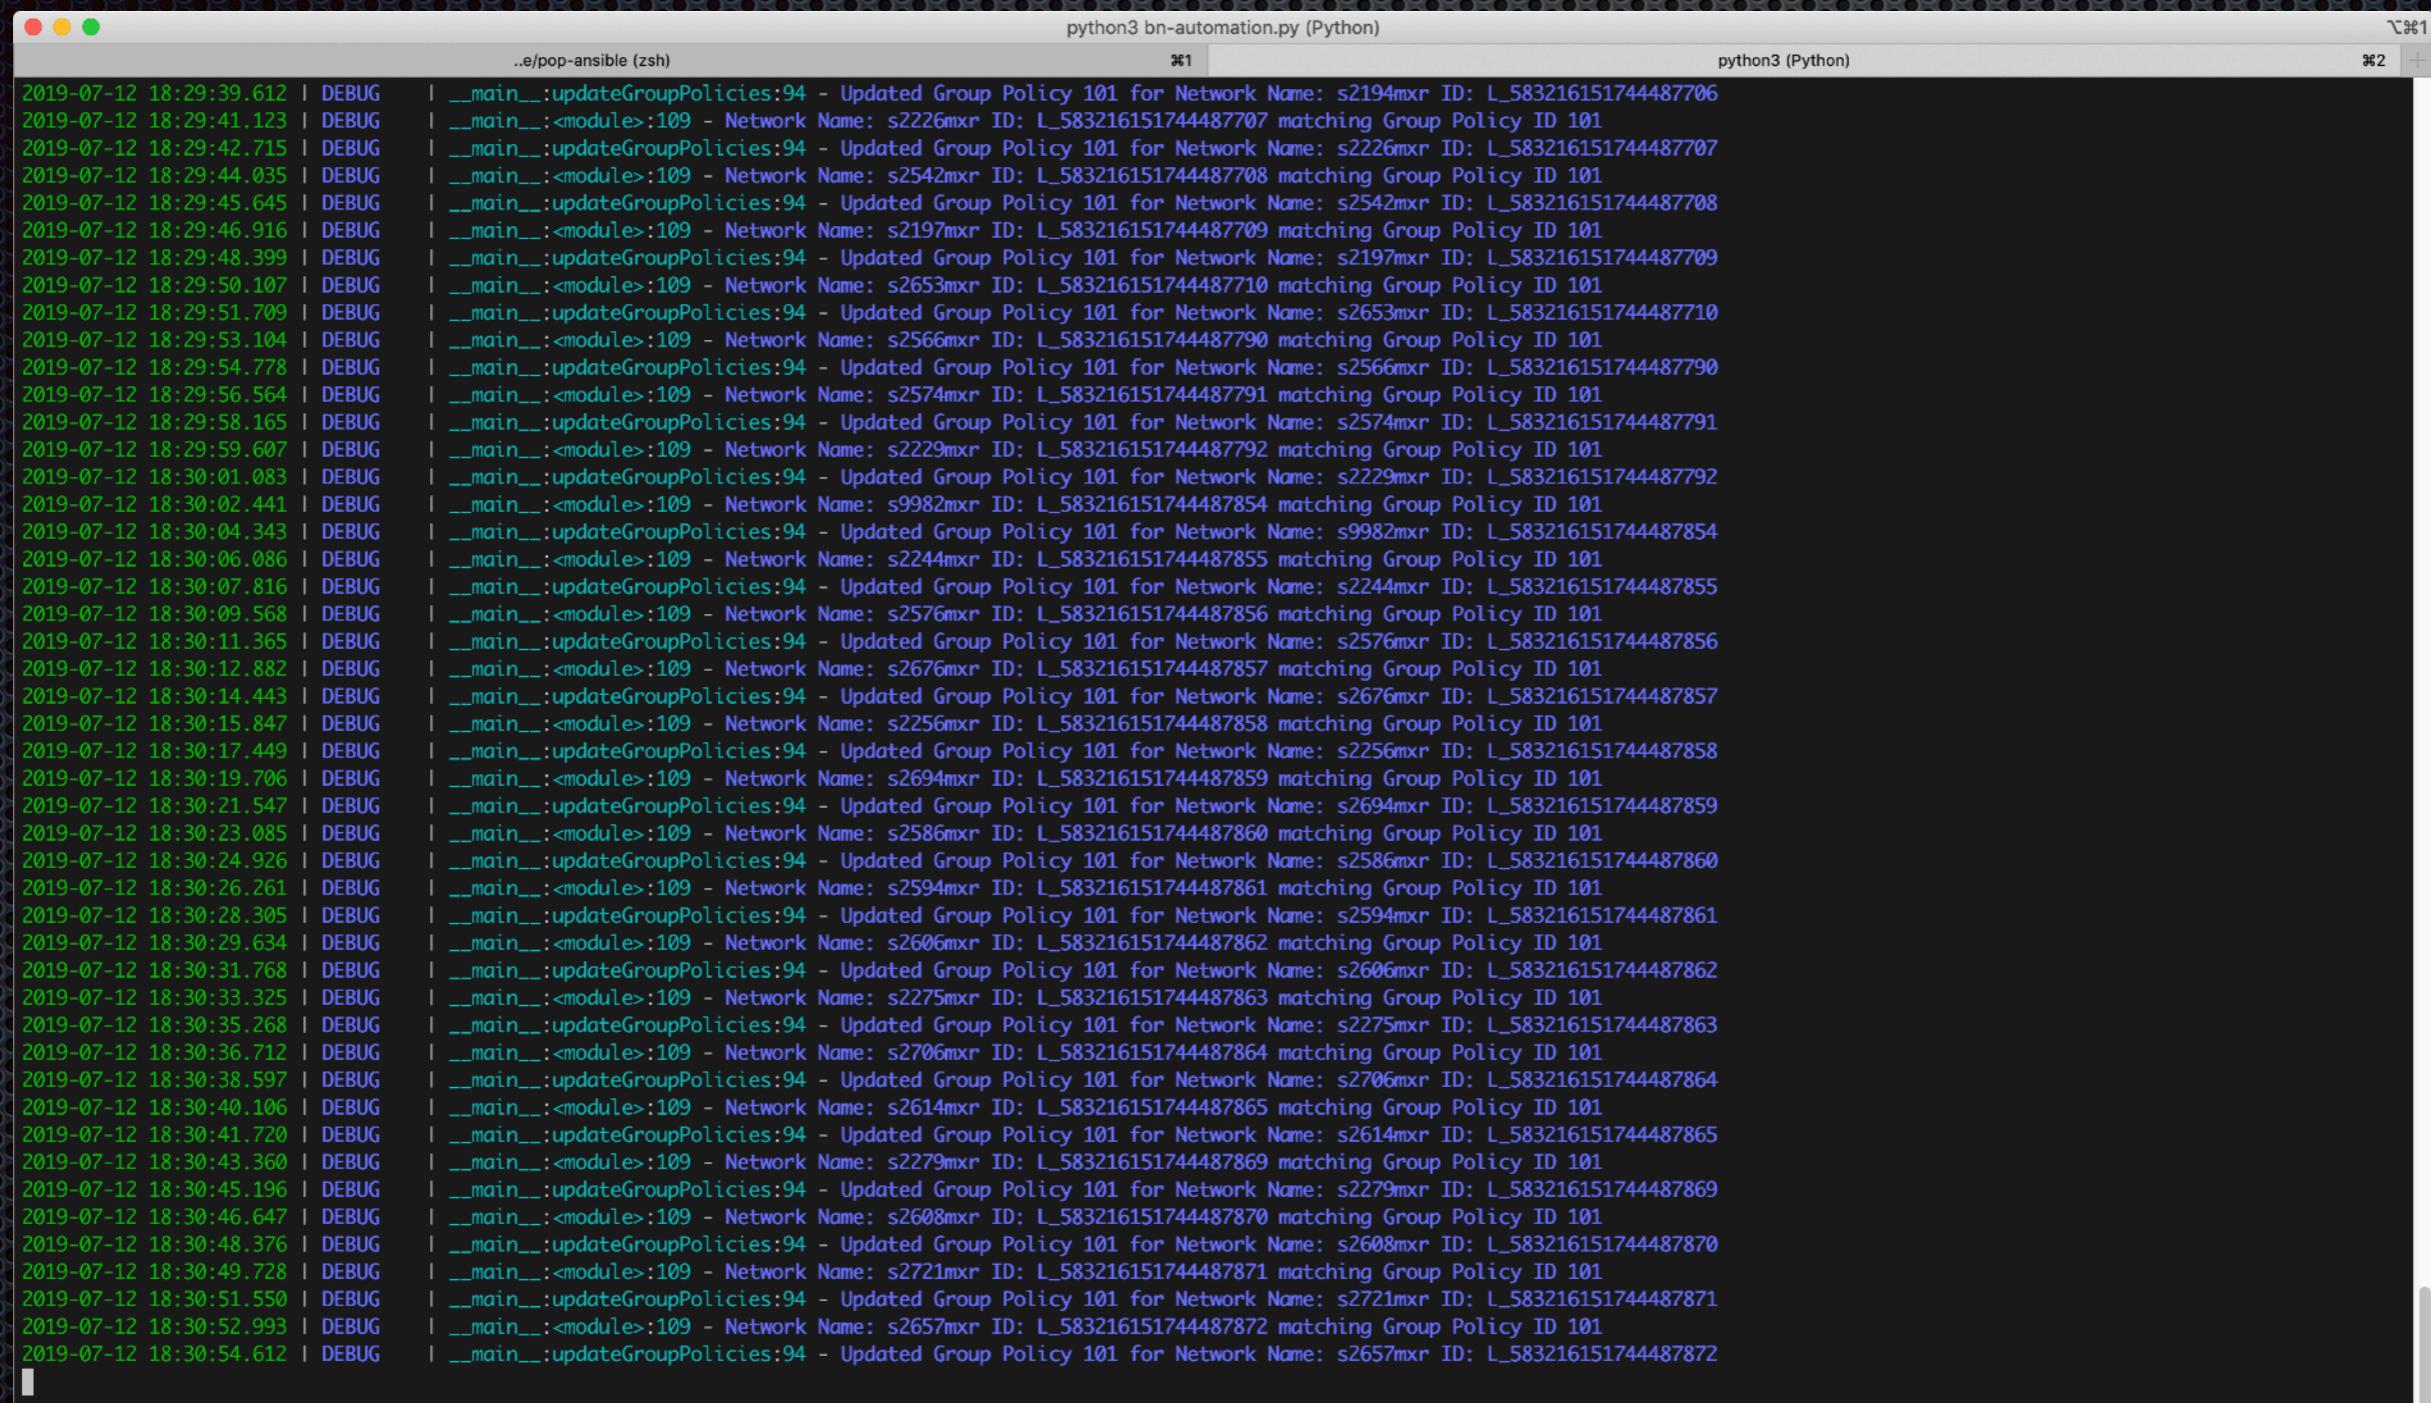

The screenshot shows a macOS terminal window with five tabs open:

- Tab 1: ..ons/repo/code (zsh)
- Tab 2: ..ndations/repo (zsh)
- Tab 3: craigb@Craigs-Mac-mini: ~/Projects/meraki-tools (zsh)
- Tab 4: ./meraki-tools (zsh)
- Tab 5: python3 (Python)

The terminal content in Tab 3 shows a JSON file being edited with the command `jq . removeCatGroupPolicy.json`. The JSON structure describes firewall and traffic shaping rules, specifically focusing on L7 Firewall Rules.

```
→ meraki-tools git:(master) jq . removeCatGroupPolicy.json
{
  "firewallAndTrafficShaping": {
    "settings": "custom",
    "trafficShapingRules": [],
    "l3FirewallRules": [],
    "l7FirewallRules": [
      {
        "policy": "deny",
        "type": "applicationCategory",
        "value": {
          "id": "meraki:layer7/category/8",
          "name": "Peer-to-peer (P2P)"
        }
      },
      {
        "policy": "deny",
        "type": "applicationCategory",
        "value": {
          "id": "meraki:layer7/category/6",
          "name": "Gaming"
        }
      },
      {
        "policy": "deny",
        "type": "applicationCategory",
        "value": {
          "id": "meraki:layer7/category/9",
          "name": "Social web & photo sharing"
        }
      },
      {
        "policy": "deny",
        "type": "applicationCategory",
        "value": {
          "id": "meraki:layer7/category/12",
          "name": "Software & anti-virus updates"
        }
      },
      {
        "policy": "deny",
        "type": "applicationCategory",
        "value": {
          "id": "meraki:layer7/category/13",
          "name": "Cloud storage"
        }
      }
    ]
  }
}
```

Use Case: Bulk Security Policy Change

```

Use Case: New Datacenter Build

- Full stack, compute/storage/FC switching/routing/switching/firewall/management etc.
- Remote site in Halifax, Nova Scotia
- Netbox DCIMs as a source of truth
 - Abstract the config specifics out of your automation code, and into a more universal DCIM tool
 - Interact with Netbox using its API & SDK

Automatic Label Generation with Netbox Data

```
#!/usr/local/bin/python3

import requests
import json
import csv

device_url = "https://netbox.cbadnms.com/api/dcim/interfaces/?device_id=491"

payload = ""
headers = {
    'Authorization': "Token ",
    'Content-Type': "application/json",
    'Accept': "application/json",
    'cache-control': "no-cache",
    'Postman-Token': "e46ffd75-f6f8-451c-a77f-d1d558968dd2"
}

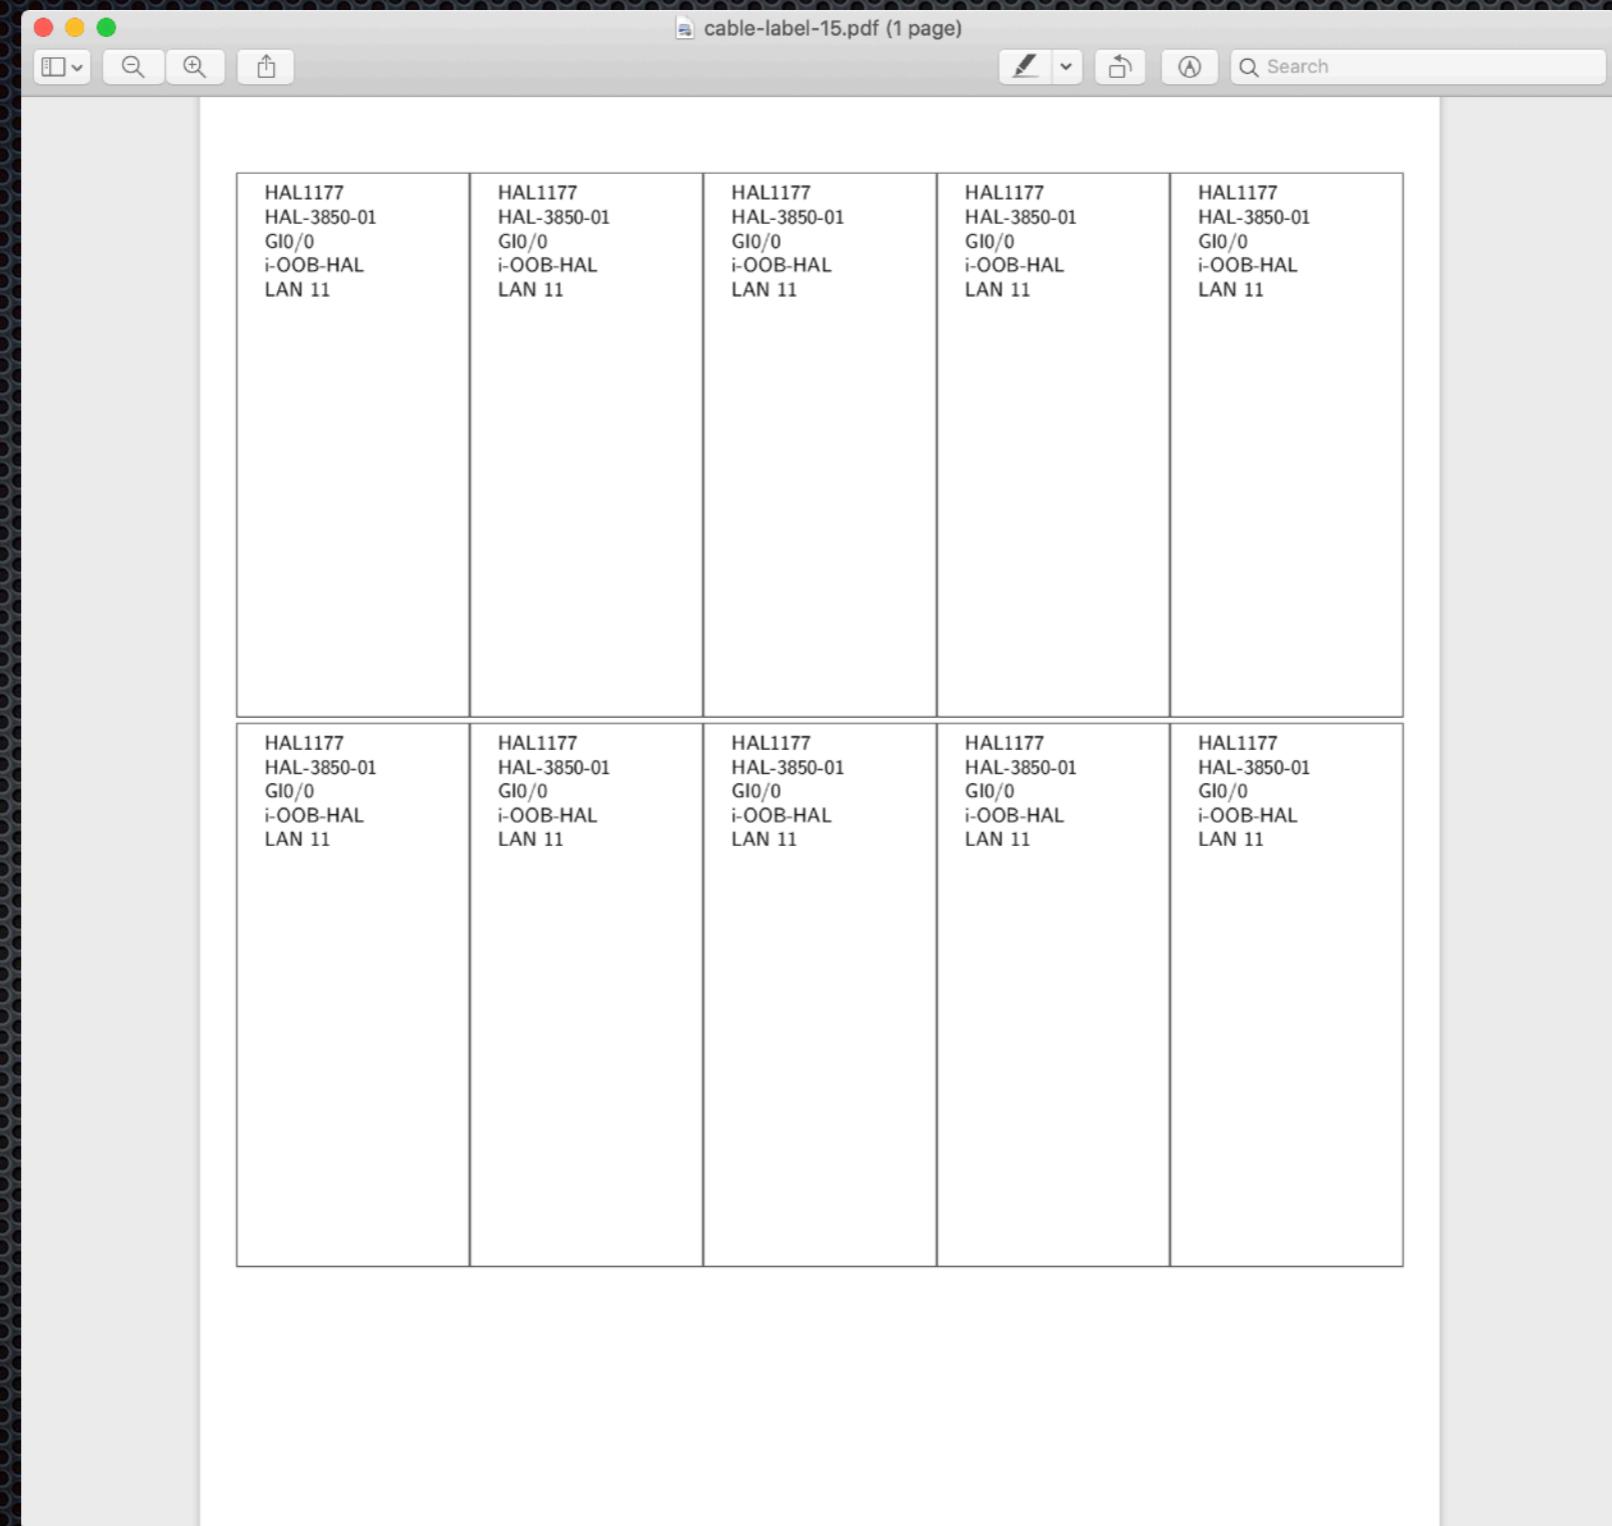

response = requests.request("GET", device_url, data=payload, headers=headers)
device_js = json.loads(str(response.text))

def getCables(device_js):
    with open('cable-data.txt', mode="w") as f:
        for interface in device_js['results']:
            if interface['cable']:
                print("Found cable " + str(interface['cable']['id']))
                cable_url = (interface['cable']['url'])
                response = requests.request("GET", cable_url, data=payload, headers=headers)
                cable = json.loads(str(response.text))
                f.write("HAL-" + str(cable['id']) + '\n')
                f.write(cable['termination_a']['device']['name'][5:] + '\n')
                f.write(cable['termination_a']['name'].upper() + '\n')
                f.write(cable['termination_b']['device']['name'][5:] + '\n')
                f.write(cable['termination_b']['name'].upper() + '\n')
                f.write('\n')

def makeCSV(cables):
    with open('cable-matrix.csv', mode='w') as f:
        fieldnames = ['Cable ID', 'Device A', 'Interface A', 'Device Z', 'Interface Z']
        writer = csv.writer(f)
        writer.writerow(fieldnames)
        writer.writerows(cables)

getCables(device_js)
#makeCSV(device_js)
```

Resulting Patch Cable Labels

Advanced Example: Velocloud SD-WAN on AWS Provisioning using API and Terraform

- [YouTube](#)

Please, No More Tools!

- This automation journey has an rapidly evolving, seemingly infinite toolchain
- Postman tool to interact with Web Service APIs
- Continuous Integration / Continuous Deployment (CI/CD) Tools
 - Travis, Jenkins, etc.
- Other Infrastructure as Code (IAC) Tools
 - Terraform, Cobbler, Chef, Puppet
- Python Libraries
 - Napalm, Paramiko, Netmiko
- Loads of SDKs by OEMs and community
- Terminals, shells, and add-ons

Do You Even Tool, Bro?

Thoughts on DevOps

- “DevOps is a cultural and professional movement, focused on how we build and operate high velocity organizations, born from the experiences of its practitioners” - Adam Jacob, CTO Chef
- There is no “The Business” - We’re all The Business
- How can these tools and strategies change my job and affect my business processes?

Where to Start?

- ✖ Evaluate your environment, and which components have mature tooling (APIs, SDKs, Ansible Modules, etc)
- ✖ Preferably, pick something you have domain knowledge of
- ✖ “To err is human; to propagate errors massively at scale is automation.”
- ✖ Read operations —> Config Generation —> Direct Config Manipulation
- ✖ Education / Community / Consulting & Professional Services
- ✖ Some low fruit
 - ✖ Auditing / Reporting
 - ✖ Labeling
 - ✖ Greenfield deployments, perhaps L2 switching

Resources

- ✖ Courses
 - ✖ Charles Severance [Python for Everybody](#)
 - ✖ [realpython.com](#)
 - ✖ [A Cloud Guru](#) - Git, Ansible, Chef, AWS, Azure...
 - ✖ <https://www.tutorialspoint.com/ansible>
- ✖ Books

- ✖ Community
 - ✖ IRC Freenode #ansible, #ansible-network
 - ✖ Packet Pushers - [Datanauts 166](#)

Feedback

- Understandable?
- Useful?
- Labs?
- Less of...
- More of...

Future Topics

- Ansible 201
- Python 201
- Git 201
- Terraform
- Specific SDKs
- AWS networking
- Container networking
- Serverless
- CI/CD

Thanks for coming, I'll be here all week,
be sure to tip the waitress
